

# HOW TO CLASSIFY A

# SPINAL CORD

# INJURY

## NOMENCLATURE & CLASSIFICATION

- **tetraplegia:** impairment or loss of motor and/or sensory function in the **cervical** segments due to damage of neural elements within the spinal canal
  - ↳ usually means person has impairment of function in arms, legs, trunk, & pelvic organs
  - ↳ doesn't include brachial plexus injuries or peripheral nerve injuries
- **paraplegia:** impairment or loss of motor and/or sensory function in the **thoracic, lumbar, or sacral** neurological segments due to damage of the neural elements within the spinal canal
  - ↳ usually means person has impairment of function in legs, trunk, & pelvic organs
  - No impairment in upper extremities
  - ↳ does include injuries to cauda equina and conus medullaris
  - ↳ doesn't include lumbosacral plexus injuries or peripheral nerve injuries
- **complete injury:** **absence of sensory and motor function** in the lowest sacral segment (no anal wink / no deep anal sensation)
- **incomplete injury:** **partial preservation of sensory and/or motor functions** is found below the neurological level and includes the lowest sacral segment
- **sacral sensation:** sensation at the anal mucocutaneous junction and deep anal sensation
  - ↳ test of motor function → presence of voluntary contraction of the external anal sphincter upon digital examination
    - basically stick your finger in person's anus & ask them to contract ...
  - ↳ **May be the only evidence of an incomplete SCI**
- **spinal shock:** when spinal cord basically shuts down initially after injury
  - ↳ complete loss of reflex activity occurs **below level of injury**
  - ↳ occurs immediately after injury
  - ↳ duration varies from 1 week → 3 months post injury
  - ↳ flaccid paralysis below level of lesion
  - ↳ no bowel or bladder tone
  - ↳ increased spasticity may indicate resolution of spinal shock
  - ↳ cannot determine if lesion is complete or incomplete during spinal shock!
- **zone of partial preservation:** dermatomes & myotomes caudal to the neurological level that remain **partially innervated**
  - ↳ recorded as the exact segments with impaired sensory and motor function found below the lowest normal segment
  - ↳ **ONLY FOR COMPLETE INJURIES**

- **skeletal level:** level where the most **vertebral damage** is found
- **neurological level:** most caudal segment with **normal sensory & motor functions** bilaterally
  - ↳ so below this level, you will see impairments for dermatomes & myotomes
  - ↳ **4 different segments:**
    - R sensory
    - L sensory
    - R motor
    - L motor
  - ↳ each segment is evaluated separately
- \* **skeletal level & neurological level** are often not the same

## CLASSIFICATION OF SCI

- **ISNSCI (ASIA):** International Standards for Neurological Classification of Spinal Cord Injury
  - ↳ published by ASIA (American Spinal Injury Association)
  - ↳ **purpose:**
    - to have a universal definition of level, completeness of injury, & classification
    - describes level of impairment (AIS A,B,C,D)
    - to provide a format of testing to improve reliability and accuracy between raters
    - reliability of national database / multi-center research
  - ↳ **sensory exam:** \* **TESTS DEEP ANAL PRESSURE, SHARP/DULL, & LIGHT TOUCH**
    - determines the most caudal normally innervated dermatome on both sides of the body
    - **evaluates:**
      - ↳ spinothalamic tract (contralateral) = sharp/dull and pain/temp
      - ↳ DCMT = light touch, light pressure

	<b>sharp/dull</b> ↗	<b>light touch</b> ↗	<b>deep anal sensation</b> ↗
METHOD	<ul style="list-style-type: none"> <li>• use a standard safety pin</li> <li>• face is a reference point for normal</li> <li>• have patient close eyes</li> <li>• start at C2 &amp; work DOWN</li> <li>• apply light pressure w/o pin movement after making contact</li> <li>• ensure random order of sharp &amp; dull sides of pin</li> <li>• need <b>8/10 correct answers</b> to document as intact</li> </ul>	<ul style="list-style-type: none"> <li>• use tapered wisp of cotton</li> <li>• face is a reference point for normal</li> <li>• have patient close eyes</li> <li>• start at C2 &amp; work DOWN</li> <li>• cotton applied distance &lt;1cm</li> <li>• ask pt to localize sensation</li> <li>• do NOT ask leading questions</li> <li>• need <b>8/10 correct answers</b> in transitional areas to document as intact</li> </ul>	<ul style="list-style-type: none"> <li>• <b>MOST IMPORTANT PART OF THE WHOLE EXAM</b></li> <li>↳ tells us if complete or incomplete SCI</li> <li>• put on gloves &amp; insert your finger into their rectal area</li> <li>• don't go past DIP</li> <li>• "let me know when you feel my finger"</li> <li>• ask patient to squeeze</li> <li>• patient describes sensory awareness (touch/pressure)</li> </ul>
GRADING	<p><b>0 → absent</b> (unable to distinguish sharp/dull)</p> <p><b>1 → impaired</b> (can tell difference but feels different from cheek)</p> <p><b>2 → normal</b> (can distinguish sharp/dull, feels same as face)</p>	<p><b>0 → absent</b> (doesn't correctly/relatively report being touched)</p> <p><b>1 → impaired</b> (correctly reports being touched but feels different from cheek)</p> <p><b>2 → normal</b> (correctly reports being touched &amp; describes same feeling as cheek)</p>	<p><b>absent</b> ↳ may indicate a complete SCI, but need to complete the rest of ISNSCI first</p> <p><b>present</b> ↳ automatically an incomplete SCI</p>

\*if key sensory point is unable to be tested, use another point within dermatome & document

if completely unable to test, document as "NT" for not tested

### ↳ Motor exam: \*TESTS 10 KEY MUSCLES

- determines the most caudal motor segment intact bilaterally
  - ↳ intact innervation = grade of  $\geq 3$  AND the next rostral key muscle has a grade of 5
  - ↳ for myotomes that are not represented by key muscles, the motor level is presumed to be the sensory level
- Completed by testing 10 key muscles on each side
- method:
  - ↳ perform with patient in supine
  - ↳ start at C5 on one side and work down
  - ↳ it is NOT NECESSARY to place each muscle in all testing positions
  - ↳ be aware of substitution patterns
  - ↳ Stabilize proximally on Grade 4 & 5 and palpate the muscle you're testing
- grading:
  - ↳ 0: no visible or palpable contraction
  - ↳ 1: any visible or palpable contraction
  - ↳ 2: muscle is able to move at least once, through full ROM (or max allowable ROM) in gravity-reduced position
  - ↳ 3: muscle is able to move, at least once, against gravity
  - ↳ 4: patient can complete grade 3 with some resistance against examiner
  - ↳ 5: patient is able to exert normal resistance against examiner
  - ↳ 5+: examiner feels patient could exert normal resistance in absence of pain, disease, etc.
  - ↳ NT: not testable, muscle is unavailable

### ↳ ASIA IMPAIRMENT SCALE:

- ASIA A: Complete SCI
    - ↳ no sensory or motor function is preserved in the sacral segments
    - ↳ NO VAC or DAP
  - ASIA B: sensory incomplete, motor complete (considered a complete SCI)
    - ↳ sensory function is preserved below the neurological level and includes the sacral segments S4-5 (light touch, sharp/dull, or DAP) AND no motor function is preserved more than 3 levels below the motor level on either side of the body
    - ↳ may present like ASIA A but has sensation below the level of the lesion and no motor function below that level → **AS A result, need to do ZPP for ASIA B patients!**
  - ASIA C: motor incomplete,  $< \frac{1}{2}$  muscles below NLI  $\geq 3/5$ 
    - ↳ motor function is preserved below the neurological level
  - ASIA D: motor incomplete,  $> \frac{1}{2}$  muscles below NLI  $\geq 3/5$ 
    - ↳ motor function is preserved below the neurological level
  - ASIA E: normal motor and sensory function
- \* to be motor incomplete ASIA C or D, motor function must be present in either the lowest sacral segment OR more than 3 levels below motor level ( $> 3$  key muscles)

key muscles	
C 5	elbow flexors
C 4	wrist extensors
C 7	elbow extensors
C 9	long finger flexors
T 1	small finger abductors
L 2	hip flexors
L 3	knee extensors
L 4	ankle dorsiflexors
L 5	great toe extensors
S 1	ankle plantar flexors

# HOW TO FILL OUT THE ISNCSCI

↳ EXAMPLE:

NEUROLOGICAL LEVELS Steps 1-5 for classification on reverse 1. SENSORY [T10] [T10] 2. MOTOR [T10] [T10]		3. NEUROLOGICAL LEVEL OF INJURY (PLI) T10		4. COMPLETE OR INCOMPLETE? Incomplete = Any sensory or motor function is S4-S5 5. ASIA IMPAIRMENT SCALE (AIS) A	
This form may be copied freely but should not be altered without permission from the American Spinal Injury Association. REV 4/11					

## 1. Neurological levels:

- ↳ for both sensory & motor, look for the most caudal segment with normal sensory & motor functions
  - **sensory:** on the L, the most caudal normal (2/2) segment is T10 (the R side happens to be the same level)
  - **motor:** on the L, the most caudal normal segment is T1, BUT since there no myotomes represented by key muscles from T2-L1, the motor level is presumed to be the sensory level, which is T10 (the R side also happens to be the same)

## 2. Neurological level of injury:

- ↳ the most caudal segment with both sensory & motor function bilaterally.
- ↳ T10 is the neurological level in this case → lowest level w/ full function
  - (ex) if sensory was T10 on R & L and motor was T5 on R & L, the neurological level would be T5.

## 3. Complete or incomplete SCI:

- ↳ look at VAC, sensory points, and DAP
  - if the line spells NOOOON, it is a complete injury AND ASIA A
  - if the line has a Y in VAC or DAP, it is an incomplete injury with at least ASIA B
- ↳ VAC, sensory points, and DAP: for this case, it spells "NOOOON" so it is a complete SCI

## 4. ASIA impairment scale:

- ↳ see notes above on how to decide!
- ↳ ASIA: A because it is a complete SCI

## 5. Zone of partial preservation:

- ↳ for complete SCI only!
- ↳ sensory & motor levels caudal to the NL that remain partially innervated
- ↳ ZPP: T11 for all in this case → T11 is the most caudal segment that's >0 for sensory, and then use the same concept for motor as determining the motor level (no myotomes T2-L1 → use sensory)
